CURRENT ROLE — RESPONSIBILITIES (short version)

Cloud Engineer — D3V Technology Solutions (Nov 2024 - Present)

- Own production Google Cloud platforms for client workloads (GKE, Cloud Run, Compute Engine, Cloud SQL, GCLB) — infrastructure, security, reliability, and cost.
 - Lead cloud security: SCC assessment frameworks (10 pillars), IAM/VPC hardening, Cloud Armor WAF, Kubernetes RBAC, container image scanning, incident response.
 - Built D3V's Google SecOps (Chronicle SIEM/SOAR) & Mandiant partner security practice from zero — authored the business plan, service/pricing plans, technical guides, and sales decks.
 - Architect secure infrastructure-as-code with Terraform (three-state model, zero-public-IP designs); build CI/CD pipelines (Cloud Build, GitLab CI, Jenkins) with GitOps-only guardrails.
 - Drive migrations (AWS→GCP, on-prem→GCP), FinOps optimization (~\$2.9k/mo spend, 94% egress cost cut), and direct client engagements (demos, assessments, workshops).
-

ROLES / LEADS I SERVE & THE ENGINEER I AM

Engineering hats I wear (use the ones matching the job): - Cloud Engineer (core) · Platform Engineer · DevOps Engineer · SRE (reliability/incident ownership) - Cloud Security Engineer / DevSecOps · Incident Response Lead · Security Assessment Lead - Security Practice Builder / Partner Security Enablement · SecOps (SIEM/SOAR) Specialist - FinOps / Cost Engineer · Migration Engineer · Customer / Solutions Engineer · Technical Writer (published playbooks)

Leads & partners I have served: - D3V Tech Lead — I took over a Kubernetes (WordPress on GKE) production project solo while my lead was away; fixed a production pipeline outage, delivered RCA + post-mortem. - Client stakeholders & executives — presented architecture, security assessment findings, and reports directly to client technical and business leads. - Cross-functional engineers (developers, contract WordPress dev, QA) — unblocked deploys, documented runbooks, enforced GitOps guardrails.

FULL WORK TIMELINE AT D3V (consolidated)

Aug 2026 — Client WordPress Platform · Incident Response & Secure Rebuild

- Led forensic investigation and secure rebuild of a compromised client WordPress platform.
- Forensics via IAP: Investigated a public-IP WordPress VM breached through exposed SSH (cryptominer/botnet payload; root login from hostile scanning range). Identified malware persistence (trojanized libudev.so, cron/init.d chain, fake kernel threads), collected IoCs, mapped kill-chain to MITRE ATT&CK.
- Data Sanitization: Recovered and scrubbed database dumps and uploads in isolated sandbox — purged sessions, invalidated all password hashes, removed secrets, stripped executable files.
- Secure Rebuild (Terraform + Cloud Foundation Fabric): Rebuilt as private, defense-in-depth platform — no public IP, IAP-only SSH, HTTPS load balancer with Google-managed cert, default-deny firewall, restricted Cloud NAT egress, fresh WordPress core, credentials in Secret Manager.
- DNS Cutover & Observability: Cut over client domains to new load balancer, delivered as-built doc + ops runbook, aligned Cloud Monitoring alerting.

Mar 2026 - Present — AI Cart Platform · Incident Response & Reliability

- Led RCA for critical staging outage, enforcing GitOps pipeline-only cluster deployments, LF line-ending standardization, and local workspace parity checks (mu tooling) to eliminate configuration drift.
- ERPNext (Frappe) Migration to GCP: Led migration using Cloud Foundation Fabric modules and three-state Terraform model.
- Zero-Public-IP Architecture: Private Compute Engine behind Global Load Balancers, all egress via Cloud NAT, admin SSH through IAP tunnels.
- Isolated State Design: Split infrastructure into shared/test/prod Terraform backends for blast-radius isolation.
- Stateful Spot Compute: Cost-efficient Spot VMs via independent disks with `reuse_existing_disks`, `auto_delete=false`, daily snapshot policies.
- Security Incident Response & Infrastructure Hardening: Led emergency incident response during a March 2026 security breach, querying Cloud Audit Logs and VPC Flow Logs to trace attacker's path and isolate compromised entry points.
- Public Database Remediation: Revoked public IP access on Cloud SQL, enforced strict private IP connectivity.
- Zero-Trust Access Control: Architected cross-project developer access via IAP tunnels and hardened Compute Engine Bastion host, eliminating public internet exposure.

Nov 2025 - Mar 2026 — AI Cart Platform · FinOps & Governance

- Modeled and optimized multi-tier GCP infrastructure spending (~\$2.9K/mo) across GKE, Cloud SQL, networking, and Cloud Armor.

May - Oct 2025 — AI Cart Platform on GKE + Security Assessments

- Owned AI-driven cart & purchasing automation engine for US brands across dedicated multi-environment GKE clusters.
- Cluster Migration: Migrated automation engine from Cloud Run to dedicated multi-environment GKE clusters.
- Geo-Distributed Network Emulation: Designed hub-and-spoke proxy fleet (Compute Engine MIGs + Tinyproxy) for regional IP emulation with dynamic rotation to bypass anti-bot blocks.
- Session Continuity & Edge Security: Fixed WebSocket disconnects via NGINX consistent-hashing, GCLB cookie affinity, Downward-API pod IP injection. Hardened perimeter via Cloud Armor WAF and GCP API Gateway (JWT/API Key auth).
- Autoscaling & Decoupling: Custom NGINX-connection HPA with preStop lifecycle hooks for zero mid-session kills. Decoupled monolithic HTTP into async Pub/Sub-Redis-KEDA worker architecture with Blue-Green deploys.
- Cost Optimization: End-to-end egress cost model, reduced outbound payload sizes from 18MB to 1MB.
- SCC Security Assessments: Architected 10-pillar assessment framework blending automated SCC Premium detectors with hands-on Cloud DLP, Web Security Scanner, and custom CIS postures.
- Automated Scoring Dashboard: Streamlined findings ingestion via GCS exports and Storage Transfer Service, feeding central dashboard that auto-generated client security scores and actionable reports.

Jan - Apr 2025 — First Ownership

- CI/CD Pipeline Repair: Diagnosed and resolved production pipeline outage for WordPress on GKE, restored automated Cloud Build deployments, delivered full post-mortem.
- Serverless & Networking: Deployed production Cloud Run microservices with Direct VPC Egress and static Cloud NAT IPs for partner API whitelisting.
- Cloud-to-Cloud Migrations: Executed AWS-to-GCP migrations across database tiers, application runtimes, S3-to-GCS object storage, and AWS Lambda to Cloud Functions with automated CI/CD.

Jul - Aug 2026 — Security Practice Build (Sole Author, Current)

- Built D3V's Google SecOps (Chronicle SIEM/SOAR) & Mandiant partner practice end-to-end:
- Business plan for standalone SecOps & Mandiant service + Extended CloudCare security tier.
- Service plans: SecOps SIEM/SOAR partner plan + Mandiant partner plan.
- Pricing tiers guide + engagement pricing model. Worked example: MDR for 1,000-emp Enterprise Plus = \$18,000/mo.
- Technical guides (1,400+ lines): Chronicle/SIEM/SOAR/Mandiant explainer, GCP SIEM/SOAR partner guide, GCP Mandiant retainer guide, Expertise-on-Demand menu, CloudCare comparison, security glossary.
- Sales materials: Google Security sales pitch + SecOps/Mandiant pitch decks (Python deck builder).
- Product depth: Google SecOps (UDM, YARA-L, SOAR playbooks), GTI, Mandiant Advantage/MDR, agentic SOC, Model Armor, SCC pillar scans, Wiz CSPM comparison.
- SecOps/SOAR Integration & Auto-Remediation: Configured and troubleshot Chronicle SIEM/SOAR integration instances (GoogleCloudApi, EmailV2), built Python CLI tool for instance management, achieved first end-to-end auto-remediation (alert → case → playbook → rogue SA disabled → confirmation email). Authored 18 YARA-L detection rules (5 live + alerting), 22 curated detection sets enabled, and documented full integration saga knowledge base.

NERVESCAPE ANALYTICS LLP — Intern (May 2024 - Oct 2024)

- **Associate Cloud Engineer Intern** — earned the Google Cloud Associate Cloud Engineer certification while applying IAM, networking, compute, storage to real-world tasks.
- Supported CI/CD setup (build triggers, deployment script troubleshooting, automation of routine ops).
- Provisioned/monitored Compute Engine, Cloud Storage, VPC; applied least-privilege IAM and firewall rules.

EDUCATION

| Degree | Institution | Year | Detail | |---|---|---|---| | B.Tech (Computer Science & Engineering) | Hooghly Engineering & Technology College | 2024 | CGPA **8.48** | | Class XII | Central Model School, Barrackpore | — | 81.8% | | Class X | Kendriya Vidyalaya No.1, Ichhapur | — | 89.3% |

CGPA vs GPA note: CGPA = Cumulative Grade Point Average (all semesters combined). GPA = single term (semester/year). Your **8.48 is on the 10-point scale** → converts to **~3.4/4.0** (US scale). If a US application asks for GPA, report **8.48/10** or the converted **~3.4/4.0** — never 8.48 as-is on a 4.0 scale.
